                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       resistance to the fungal pathogen Venturia inaequalis. Vectors comprising the polynucleotides can be used to produce transgenic plants (especially apple species; resistant to fungal pathogens, especially V. inaequalis. For example, the gene sequence encoding the protein could be incorporated with the 3S promoter of the CaMV cauliflower mosaic virus to introduce a plant defense mechanism against the pathogen, or the promoter sequence upstream from the gene could be used in chimeric constructs to promote sequences encoding for proteins which inhibit V. inaequalis. V. inaequalis is the most severe and economically important fungal pathogen of apples, causing a disease known as scab. Sequences AAY56826-848 represent apple LRPKml LRR sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     angiogenesis; vascular proliferation; diabetic retinopathy;

The antibody localizes the respective tissue within 3 to 4 hours after injection. It is used in immunoscintigraphic detection of angiogenesis and for diagnosis and therapy of tumours and diseases characterized by vascular proliferation. The antibody can be conjugated to a molecule which induces blood coagulation and blood vessel occlusion. These conjugates are used in the preparation of injectable compositions for the treatment of angiogenesis-related pathologies, especially caused by or associated with conjugates are used in the conjugates are used in the preparation of injectable compositions for the treatment of the preparation of the preparation of expectable compositions for the treatment of the conjugates are used to the conjugates are used
                                        The invention relates to an antibody with specific affinity for a characteristic epitope of the ED-B domain of fibronectin, where the antibody has improved affinity to ED-B. The invention also relates to conjugates comprising antibodies with a suitable photoactive molecule useful in the detection and/or coagulation of blood vessels. An antibody with improved affinity to the ED-B domain is useful for diagnosis and therapy of tumours and diseases characterised by vascular proliferation, cancer, rheumatoid arthritis, neo-vasculature associated ocular comprises and psoriasis. Treatment of anglogenesis related pathologies comprises the injection of conjugates comprising antibody and a molecule capable of inducing blood coagulation and blood vessel occlusion. The present sequence is single-chain variable antibody fragment (scFV) L19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Homo

C and protein sequences

C are involved in cell signalling. The polynucleotide and protein

CC sequences can be used to modify the response of plant cells to external

CC signals e.g. environmental changes or pathogens during the growth and

CC differentiation, elongation and survival, resistance to disease and

CC nutrient metabolism. Examples of modifications which can be produced are

CC altered fruit ripening and senescence of leaves and flowers e.g. to

CC delay senescence and prolong the life of cut flowers or enhance

CC senescence of reproductive organs to engineer sterile plants. Other

CC organs providing fruit and vegetables which have a longer shelf life

CC organs providing fruit and vegetables which have a longer shelf life

CC between harvest and consumption, or to decrease branching frequency in

CC organs provided and timber furniture and veneers.

                                                                                                                                                                                                                                      The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' CTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.

The protein sequences cc are involved in cell signalling. The polynucleotide and protein cc sequences can be used to modify the response of plant cells to external cc signals e.g. environmental changes or pathogens during the growth and cc differentiation, elongation and survival, resistance to disease and cc differentiation, elongation and survival, resistance to disease and cc altered fruit ripening and senescence of leaves and flowers e.g. to cc delay senescence and prolong the life of cut flowers or enhance cc enescence of reproductive organs to engineer sterile plants. Other corgans providing fruit and vegetables which have a longer shelf life cc between harvest and consumption, or to decrease branching frequency in cc forest tree species giving long stretches of valuable knot-free clear cc wood which can be used in solid timber furniture and veneers.
                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and protein sequences isolated from eucalyptus (Bucalyptus grandis) or pine (Pinus radiata also known as Monterey pine). The protein sequences are involved in cell signalling. The polynucleotide and protein sequences can be used to modify the response of plant cells to external signals e.g. environmental changes or pathogens during the growth and development of a plant. They can be used to modify cell proliferation, differentiation, elongation and survival, resistance to disease and nutrient metabolism. Examples of modifications which can be produced are altered fruit ripening and senescence of leaves and flowers e.g. to delay senescence and prolong the life of cut flowers or enhance senescence of reproductive organs to engineer sterile plants. Other modifications can be used to delay senescence in selected cell types or organs providing fruit and vegetables which have a longer shelf life to the productive organs providing frequency in or to decrease branching frequency in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     elongation; survival; disease resistance; nutrient metabolism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    signaling used for generating to external signals

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     and protein sequences isolated from eucalyptus (Eucalyptus grandis) or pine (Pinus radiata also known as Monterey pine). The protein sequences are involved in cell signalling. The polynuclectide and protein cequences sequences can be used to modify the response of plant cells to external certain colls to external certain colls to external cevelopment of a plant. They can be used to modify cell proliferation, colloquence of plants of a plant. They can be used to modify cell proliferation, colloquence of modify cell proliferation, colloquence of modifications which can be produced are cell attreed fruit ripening and senescence of leaves and flowers e.g. to cell attreed fruit ripening and senescence of leaves and flowers or enhance cell senescence of reproductive organs to engineer sterile plants. Other colloquence consumption, or to decrease branching frequency in forest tree species giving long stretches of valuable knot-free clear way wood which can be used in solid timber furniture and veneers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cc and protein sequences isolated from eucalyptus (Eucalyptus grandis) or cpine (Pinus radiata also known as Monterey pine). The protein sequences can the used to modify the response of plant cells to external cc sequences can be used to modify the response of plant cells to external cc signals e.g. environmental changes or pathogens during the growth and cc development of a plant. They can be used to modify cell proliferation, clongation and survival, resistance to disease and cc differentiation, elongation and survival, resistance to disease and cc altered fruit ripening and senescence of leaves and flowers e.g. to cc altered fruit ripening and senescence of leaves and flowers or enhance cc delay senescence and prolong the life of cut flowers or enhance cc modifications can be used to delay senescence in selected cell types or crgans providing fruit and vegetables which have a longer shelf life cc between harvest and consumption, or to decrease branching frequency in cc corgans to enserce giving long stretches of valuable knot-free clear valuable which can be used in solid timber furniture and veneers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   determining region (CDR) residues located at the periphery of the binding site. The improved antibody is used for rapid targeting markers of angiogenesis, for detecting diseases characterized by vascular proliferation, such as diabetic retinopathy, age-related macular degeneration or tumours. The antibody localizes the respective tissue within 3 to 4 hours after injection. It is used in immunoscintigraphic detection of angiogenesis and for diagnosis and therapy of tumours and diseases characterized by vascular proliferation. The antibody can be conjugated to a molecule which induces blood coagulation and blood vessel occlusion. These conjugates are used in the preparation of injectable compositions for the treatment of angiogenesis-related pathologies, especially caused by or associated with ocular proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a modified human scFv antibody which has specific affinity for a characteristic epitope of the ED-B domain of fibronectin. The affinity of the antibody for this epitope was improved by introducing a number of mutations in the complementarity determining region (CDR) residues located at the periphery of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 10; Page -;

cc sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic cc polypeptides. The proteins and their associated DNA sequences are used in cc the treatment, prevention and diagnosts of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, cc pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. Cc presence is also involved in infections of bone, joints and the central cc nervous system, however it is particularly involved in the inflammatory clesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a cc sample with a binding agent that binds to the proteins of the invention cand determining the amount of bound protein in the sample. The collective specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and ctivity of P. acnes polypeptides and ctivity of P. acnes polypeptides and datapostic agents for determining P. acnes presence, for example, by cenzyme linked immunosorbent assay (ELISA).

Cc enzyme linked immunosorbent assay (ELISA).

Cc at fire winc introduce the protection of the printed contaction, but was obtained in electronic format directly from WIPO and contacting the printed contaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC The invention relates to polynucleotides encoding novel human CC proteins or their active domains. The polypeptides, polynucleotides and CC antibodies raised against the polypeptides are used in a method of CC treatment of a mammal and prevention of disorders caused by the aberrant CC protein expression or activity. The polypeptides can be used as CC molecular weight markers, food supplements, and in antibody production. The polypeptides can be used as probes and completely polypeptides. Polynucleotides of the invention are used as probes and CC primers, for sequencing, for chromosome or gene mapping, in the CC primers, for sequencing, for chromosome or gene mapping, in the CC primers, for sequencing, for chromosome or gene mapping, in the CC production of recombinant proteins, and in generating anti-sense DNA or CR has and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to craise antibodies/elicit an immune response, to determine quantitative CC protein levels, as tissue markers, and to isolate receptors or ligands. Sistem call disorders, regenerating bone, cartilage, tendon, the proliferation, differentiation and survival of stem cells, as a alzheimer's, parkinson's and Huntington's diseases, amylotrophic lateral sclerosis, stroke, immune deficiencies resulting from bacterial, viral or fungal infection or from autoimmunity, cancer, allergy, asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC The invention relates to polynucleotides encoding novel human CC antibodies raised against the polypeptides, polynucleotides and treatment of a mammal and prevention of disorders caused by the aberrant CC molecular weight markers, food supplements, and in antibody production. The polypeptides are used as probes and CC The polypeptides are used to identify compounds which bind to the CC primers, for sequencing, for chromosome or gene mapping, in the CC primers, for sequencing, for chromosome or gene mapping, in the CC primers, for sequencing, for chromosome or gene mapping, in the CC primers, for sequencing, for chromosome or gene mapping, in the CC primers, for sequencing, for chromosome or gene mapping, in the CC primers, for sequencing, for chromosome or gene mapping, in the CC primers, for sequencing, and in generating anti-sense DNA or CC target drugs to a tumour, in assays to determine biological activity, to CC raise antibodies/molicit an immune response, to determine quantitative CC protein levels, as tissue markers, and to isolate receptors or ligands CC protein levels, as tissue markers, and to isolate receptors or ligands. CC disorders, stem cell disorders, regenerating bone, cartilage, tendon, CC the proliferation, differentiation and survival of stem cells, as a CC contraceptive, treating osteoporosis and osteoarthritis, anaemia, CC alzheimer's, Parkinson's and Huntington's diseases, amylotrophic lateral CC contraceptive, treating osteoporosis and osteoarthritis, anaemia, CC anti-inflammatory disease, eczema, haemophilia, thrombosis, anti-inflammatory diseases, nervous system disorders, and infection.

The present sequence represents a protein of the invention.

The polynucleotides encoding the disease resistance proteins are useful for increasing resistance in a plant to disease, controlling cell death, and conferring resistance to herbicides. They are useful as probes or amplification primers in the detection, quantification, or isolation of gene transcripts. They can be used for recombinant expression of their encoded polypeptides, as immunogens in the preparation and/or screening of antibodies, and in sense or antisense suppression of the polynucleotide in a host cell, tissue or plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     a Zea mays gene homologue for a leucine-rich repeat (LLR) containing disease resistance gene of the Cf-2 or Cf-9 type. These novel maize disease resistance polymucleotides and polypeptides are useful for enhancing disease resistance in crops and transgenic plants including maize, soybean, sunflower, sorghum, canola, wheat, alfalfa, cotton, rice, barley or millet. The level of disease resistance protein is increased barley or millet.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel isolated maize disease resistance polynucleotide useful for increasing resistance in a plant to disease, controlling cell death, and conferring resistance to herbicides -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 11;

                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

Sequence 83, Application US/09228986

Patent No. 6359198

GENERAL INFORMATION:
APPLICANT: Strabala, Timothy
APPLICANT: Nieuwenhuizen, Niels
TITLE OF INVENTION: Compositions Isolated from Plant Cells
TITLE OF INVENTION: And Their Use in the Modification of Plant Cell Signalling
FILE REFERENCE: 11000/1020
CURRENT APPLICATION NUMBER: US/09/228,986
CURRENT FILING DATE: 1999-01-12
NUMBER OF SEQ ID NOS: 130
SOFTWARE: FastSEQ for Windows Version 3.0
SEQ ID NO 83
LENGTH: 153
TYPE: PRT
ORGANISM: Pinus radiata
                                                                                                                                                                                                                                                                                                                                                             US-09-252-991A-24232
; Sequence 24232, Application US/09252991A
; Patent No. 6551795
US-09-252-991A-24232
                         APPLICANT: MATC J. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

FILE REPERENCE: 107105.136

CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               seq length: 0

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                             Score
